Our brave scuba-divers have been researching the tropical waters beneath the foothills of Toeland.

Use the special scuba gauge to fill in the data below (using your own foot to provide the measurements).

WARNING: Mind where you tread or you could damage the fragile seabed!

Measuring Guide

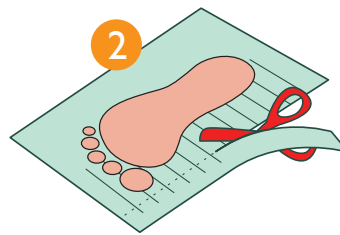

To be used with any of the downloadable measuring gauges available on our website

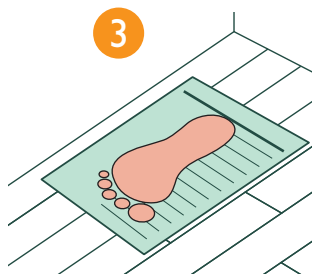

This guide will help you to correctly measure your child's feet, so when you buy online from us, you can shop with confidence. Remember, when your shoes arrive you should assess the fit using our fitting guide. You can download it from: startriteshoes.com/fittingguide

Print out the gauge. Check that the gauge has printed at the correct size by comparing the millimetre markings against a ruler. Make sure your printer it is set to 100% or 'do not scale'.

Cut along the dashed line to remove the width measure from the sheet. Then snip, snip, snip and you're done.

Place the chart on a hard floor surface. You may wish to place the heel line up against a wall for easier measuring.

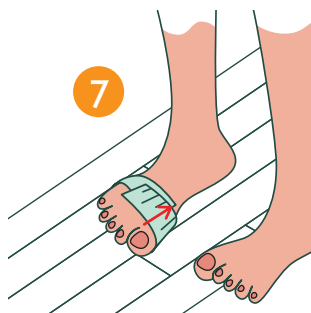

Position your child's heel as shown. The back of the heel should line up with the thick line. For best results your child should be standing against a wall and on a hard surface. Distribute weight equally between both feet.

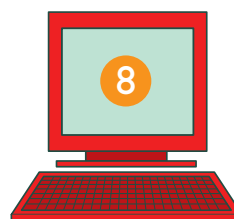

Measure the maximum length. You don't need to allow extra, our website does all that. Measure both feet and select the greatest figure.

Take the width measure and place under your child's foot and wrap around at the widest point as shown. The widest point is diagonally across the foot from the big toe joint to the little toe joint.

Pull the measure gently and read the measurement where it meets the starting point.

Enter the width and length measurements into the size calculator on startriteshoes.com. Click the button and we'll work out the suggested size shoes for your child.
